Annex 3 - R script to construct Table 1A by country

Joel Vigneau, with the collaboration of Matt Elliott, Jon Elson, Kirsten Birch Hakansson, Marie Storr-Paulsen, Nuno Prista, Katja Ringhdal, Lies Vansteenbrugge, Sieto Verver

October 2016

Filling of the EU-MAP table 1A requires to report on country shares of landings and shares of EU TAC when relevant, for all the stocks listed in table 1A of the EU-MAP Regulation (EU Decision 1254/2016). This process necessitates to gather information on landings and EU TAC from an official database, namely EUROSTAT for EU landings and MARE/FIDES for EU TAC.

Two datasets were added to complete the references, (1) the Nephrops FU landings provided by ICES and (2) the Mediterranean and Black Sea landings fisgures put together by 2016 RCM Mediterranean and Black Sea.

First of all, the datasets listed above contain information from all EU Member States, which means that the script has the potential to be used by all Member States, and by STECF for control of the NWP submitted for 2017.

Setting the parameters for the analysis

The variables needed for the work are the working directory, the country code (2-letter code) and the reference years

```
library(tidyr)
library(stringr)
library(reshape)
```

```
##
## Attaching package: 'reshape'
```

```
## The following objects are masked from 'package:tidyr':
##
##     expand, smiths
```

```
CTRY <- 'DK'
refYears <- 2016:2018
```

Importing the datasets

The list of datasets are the following :

1. Landings and TAC shares files:

- EUROSTAT landings files: http://ec.europa.eu/eurostat/web/fisheries/data/database
- MARE/FIDES TAC file: https://webgate.ec.europa.eu/fides/index.cfm
- ICES Nephrops fishery units landings per country for 2015
- RCM Mediterranean and Black Sea 2016 landings compilation

```
DF27  <- read.table(file.path(input_path_common, "fish_ca_atl27.tsv"),header=TRUE, sep='\t', as.is=TRUE)
DF21  <- read.table(file.path(input_path_common, "fish_ca_atl21.tsv"),header=TRUE, sep='\t', as.is=TRUE)
DF34  <- read.table(file.path(input_path_common, "fish_ca_atl34.tsv"),header=TRUE, sep='\t', as.is=TRUE)
DF41  <- read.table(file.path(input_path_common, "fish_ca_atl41.tsv"),header=TRUE, sep='\t', as.is=TRUE)
DF47  <- read.table(file.path(input_path_common, "fish_ca_atl47.tsv"),header=TRUE, sep='\t', as.is=TRUE)
DF51  <- read.table(file.path(input_path_common, "fish_ca_ind51.tsv"),header=TRUE, sep='\t', as.is=TRUE)
```

```
DF37  <- read.table(file.path(input_path_common, "fish_ca_atl37.tsv"),header=TRUE, sep='\t', as.is=TRUE)

DF <- rbind.data.frame(DF27, DF21)
DF <- rbind.data.frame(DF, DF34)
DF <- rbind.data.frame(DF, DF37)
DF <- rbind.data.frame(DF, DF41)
DF <- rbind.data.frame(DF, DF47)
DF <- rbind.data.frame(DF, DF51)

TAC <- read.csv(file.path(input_path_common,'EU opening quota 2018.csv'), header=TRUE, sep=';',as.is=TRU
NEP <- read.csv(file.path(input_path_common,'Nephrops landings 2015.csv'), header=TRUE, sep=';', as.is=T
patch_land_codIIIa <- read.table(file.path(input_path_common, 'patch_codIIIa_20191009.txt'), sep = '\t'
MED <- read.csv(file.path(input_path_common,'RCM MED landings.csv'), header=TRUE, sep=';', as.is=TRUE)
```

2. Reference tables:

- EuroStat Geo.def: full names of countries
- ASFIS file : FAO species naming and coding
- Linkage table mirroring EU-MAP Table 1A naming of species and stock area, and lining to EUROSTAT and MARE/FIDES species and area naming

```
GEO     <- read.table(file.path(input_path_common,'geo.def'),header=TRUE,sep=";", as.is=TRUE)
ASFIS   <- read.table(file.path(input_path_common,'ASFIS_sp_Feb_2016.txt'), header=TRUE, sep="\t", as.is
table1A <- read.csv(file.path(input_path_common,'EUMAP_Table1A_Linkage_EUROSTAT and EC_TAC.csv'), sep='
```

data.frame preparation

The country names are matching between GEO and TAC data.frame, except for UK, so the following lines enables the full match.

```
TAC$StockID <- paste(TAC$Species.Code,TAC$Area.Code,sep="")
TAC$Level.Description[substring(TAC$Level.Description,1,3) %in% 'U.K'] <- 'United Kingdom'
```

The TAC dataset is well structured and thus ready for the analysis

```
head(TAC,3)
```

```

DFM <- merge(DFM, ASFIS[,c(3:6)], all.x=TRUE)
```

Let's have a look at the workable structure of EuroStat dataset. Note that Y1, Y2 and Y3 are the 3-year period demanded, and the presence of NA's. The assumption made here (further in the Construction of the table section) is to exclude NA from the average, i.e. like if MS had omitted to report, instead of a NA which would mean 0. The confusion comes because lots of 0 are reported in EuroStat (implicitely meaning that NA is not a 0). This point may be subject of a STECF agreement or suggestion for modification.

```
head(DFM,3)
```

```
##   X3A_CODE  geo      area   Y1 Y2 Y3                Country
